What geologic processes could influence vertical land motions in the Chesapeake Bay? D. Sarah Stamps Assistant Professor Virginia Tech, Department of Geosciences Geodesy and Tectonophysics Laboratory

=.0

Summary

## Tectonic Setting of the Chesapeake Bay

UNAVCO velocity solution

#### Minimal Seismic Activity 0-33 km depth

#### Rigid Plate Rotation

Not on a tectonic plate boundary

UNAVCO velocity solution

#### No active volcanism

#### No expected tectonic influence on the Chesapeake Bay

UNAVCO velocity solution

### Existing Estimates of Vertical Land Motions from GPS

Peltier et al. (2015)

### Existing Estimates of Vertical Land Motions from GPS

## Uplifting site ~2 mm/yr Subsidence ~0.5-4 mm/yr

# Existing Estimates of Vertical Land Motions from GPS

Peltier et al. (2015)

Karegar et al. (2016)

## All subsidence ~1-2 mm/yr

Geologic processes potentially acting on the Chesapeake Bay

# Glacial Isostatic Adjustment

Glacial Isostatic Adjustment D

Dynamic Uplift/Subsidence

Sediment Compaction

Summary

#### Glacial Isostatic Adjustment

Ice sheet depresses lithosphere beneath center of ice sheet mass

Upper mantle is displaced

Forebulges uplift

Farrand, 1962; Walcott, 1972; James and Bent, 1994; Davis and Mitrovica, 1996; Peltier, 1996; Larson and Van Dam, 2000; Calais et al., 2006; Sella et al., 2007; Eggleston and Pope, 2013; Karegar et al., 2017

Dynamic Uplift/Subsidence

Sediment Compaction

Summary

#### Glacial Isostatic Adjustment

Lithosphere rebounds

Upper mantle flows back to it's original location

Forebulges subside

forebulge forebulge

deglaciation period

Farrand, 1962; Walcott, 1972; James and Bent, 1994; Davis and Mitrovica, 1996; Peltier, 1996; Larson and Van Dam, 2000; Calais et al., 2006; Sella et al., 2007; Eggleston and Pope, 2013; Karegar et al., 2017

Glacial Isostatic Adjust has been assumed to be the primary factor in explaining North American vertical land motions (i.e. Sella et al., 2007)

Sella et al., 2007

20

Predicted Vertical Velocities (mm/yr) -2 00 -1.50-0.500.00 0.50 1.00 2.00 -1.001.50 -75° -70° -65° -90 -85 -80 45 45° 40° 40° 35° 35° 30° 30° 25° 25° -70° -85° -75° -90 -80 -65° Derived from ICE-6G model using SELEN4.0

Glacial Isostatic Adjust predicted to produce 1.5-2 mm/yr of subsidence in the Chesapeake Bay region

# Dynamic Uplift/Subsidence from Mantle Flow

Glacial Isostatic Adjustment Dynamic Uplift/Subsidence Background Sediment Compaction Summarv Dynamic Uplift/Subsidence from Mantle Flow Convecting mantle is coupled to the surface lithosphere Mantle tractions influence tectonic convecting mantle plate motions COLD Downwelling mantle flow pulls surface downwards

Spasojević et al., 2008; Forte et al., 2010; Karlstrom et al., 2012; Husson et al., 2014; Dávila and Lithgow-Bertelloni, 2015

Background Glacial Isostatic Adjustment Dynamic Uplift/Subsidence Sediment Compaction Summary

Upwelling mantle flow uplifts tectonic plates

Spasojević et al., 2008; Forte et al., 2010; Karlstrom et al., 2012; Husson et al., 2014; Dávila and Lithgow-Bertelloni, 2015

# Sediment compaction

Dynamic Uplift/Subsidence

Sediment Compaction

#### Sediment Compaction

Compaction of clastic sediments, mainly sand in the Chesapeake Bay

Dynamic Uplift/Subsidence

Sediment Compaction

Summary

#### Sediment Compaction

Compaction of clay layers from groundwater extraction

# Summary of Geologic Processes Potentially Affecting the Chesapeake Bay

Glacial Isostatic Adjustment Dynamic Uplift/Subsidence Sediment Compaction

#### No evidence for these geologic effects:

- Impact crater (35 Mya)
- Bedrock dissolution (bedrock is crystalline)
- Settling of fill and disturbed soils on a regional scale
